Remark on Some Functional Equations

VEDA KILIBARDA

Abstract. In this note we give a new and simple proofs of some D. Adamović's results.

In papers [1], [2] and [3] D. Adamović consider functional equations:

(1) \[ f(f(x + y)) = f(x) + f(y) \]

and

(2) \[ f(x + y) = f(f(x)) + f(f(y)) \]

for any \( x, y \in F \), where \( F \in \{\mathbb{R}, \mathbb{C}\} \) and \( f : F \rightarrow F \), which generalizes Cauchy equation. The aim of this note is to show that Adamović's result can be obtained by application of classical result of Pexider [5] (see also [4]).

**Proposition 1.** (Pexider [5]) The general solution of functional equation

\[ f(x + y) = g(x) + h(y) \]

where \( f, g, h : F \rightarrow F \), is given by

\[ f(x) = \varphi(x) + a + b \]
\[ g(x) = \varphi(x) + a \]
\[ h(x) = \varphi(x) + b, \]

where \( a, b \in F \) are arbitrary constants and \( \varphi : F \rightarrow F \) is arbitrary solution of Cauchy functional equation.

In fact, Propositions 1 and 2, in theirs forms given here, do not comprise the whole content of Adamović's result, which also gives the determination of idempotentical solution of the Cauchy equation (see remark). This momentum is not included in our consideration here.

**Proposition 2** (Adamović [1]). \( f \) is solution of equation (1) if and only if \( f(x) = \varphi(x) + a \) where \( \varphi \) is idempotentical \( (\varphi \circ \varphi = \varphi) \) solution of Cauchy equation and \( a \in F \) is a constant such that \( \varphi(a) = a \).

Remark on Some Functional Equations

Proof. Let $f$ be a solution of equation (1). Then, by application of Proposition 1 we have

(3) \[ f(x) = \varphi(x) + a \]

and

(4) \[ f(f(x)) = \varphi(x) + 2a, \]

where $a \in \mathbf{F}$ is a constant and $\varphi : \mathbf{F} \to \mathbf{F}$ is solution of Cauchy functional equation. By (3) and (4), we obtain

(5) \[ f(f(x)) = \varphi(\varphi(x) + a) + a = \varphi(\varphi(x)) + 2a, \]

and further

(6) \[ \varphi(\varphi(x)) + \varphi(a) + a = \varphi(x) + 2a. \]

For $x = 0$ we get

(7) \[ \varphi(a) = a, \]

such that (6) becomes

\[ \varphi(\varphi(x)) = \varphi(x). \]

On the other hand, if $f$ is given by (3) with arbitrary idempotent solution $\varphi$ of Cauchy functional equation and arbitrary constant $a \in \mathbf{F}$ satisfying (7), then by first equality in (5) and by the left side of (6),

\[ f(f(x + y)) = \varphi(\varphi(x + y)) + a + a = (\varphi(x + y)) + 2a = \varphi(x) + \varphi(y) + 2a = \varphi(x) + a + \varphi(y) + a = f(x) + f(y). \quad \square \]

Proposition 3 (Adamović [1]). If $f$ is solution of equation (2) if and only if it is idempotent (f \circ f = f) solution of Cauchy equation.

Proof. Let $f$ be a solution of equation (2). Then we have, by Proposition 1

(8) \[ f(x) = \varphi(x) + 2a \]

and

(9) \[ f(f(x)) = \varphi(x) + a, \]

where $\varphi : \mathbf{F} \to \mathbf{F}$ is a solution of Cauchy functional equation and $a \in \mathbf{F}$ a constant. By (8) and (9),

\[ \varphi(\varphi(x) + 2a) + 2a = \varphi(x) + a \]

and further

(10) \[ \varphi(\varphi(x)) + \varphi(a) + a = \varphi(x) + a. \]

For $x = 0$ we obtain

(11) \[ 2\varphi(a) = -a, \]

such that (10) becomes

(12) \[ \varphi(\varphi(x)) = \varphi(x). \]
From (11) and (12) follows

\[ \varphi(a) = \varphi(\varphi(a)) = \varphi(-\frac{a}{2}) = -\frac{1}{2} \varphi(a) = \frac{a}{4}. \]

Hence

\[ -\frac{a}{2} = \frac{a}{4}, \]

which implies \( a = 0 \). So we have \( f = \varphi \) and consequently \( f \circ f = f \).

On the other hand, a direct verification shows that every idempotent solution of Cauchy equation satisfies equation (2).

\[ \square \]

Remark 0.1. In Proposition 1 and 2 we gives the description of general solution of equations (1) and (2), by idempotent solution of Cauchy equation, which complete determination was obtained by D. Adamović [1]. Some simple corrections of this result were given in [3].

Proposition 4 (Adamović [3]). If \( g : F \to F \) is idempotent solution of Cauchy equation, then

\[
g(x) = \begin{cases} 
  x, & \text{for } x \in H_0 \\
  L(H_0), & \text{for } x \in H \setminus H_0 \\
  \sum_{h \in H} \alpha_h g(h), & \text{for } x = \sum_{h \in H} \alpha_h h
\end{cases}
\]

where \( H \) is arbitrary Hamel base of \( F \), \( \emptyset \neq H_0 \subseteq H \), \( L(H_0) \) is a linear hull of \( H \), \( \alpha_h \) rational numbers.

From this proposition follows that only continuous idempotent solution of Cauchy equation is identical mapping.

Acknowledgment. The author is deeply grateful to Prof. D. Adamović and Prof. I. Arandelović for their helpful suggestions and guidance throughout the writing of this paper.
